GitHub

Hands-on practice

Git

- ▶ Don't confuse Git with GitHub
 - ▶ Git is a version control tool
 - ▶ GitHub provides cloud services using Git (remote repositories, bug tracking, wiki page...)

Git

- ▶ Don't confuse Git with GitHub
 - ▶ Git is a version control tool
 - ▶ GitHub provides cloud services using Git (remote repositories, bug tracking, wiki page...)
- ▶ Git is not like Dropbox or Google Drive
 - ▶ True version control, not just file history
 - ▶ Need to resort to console sooner or later

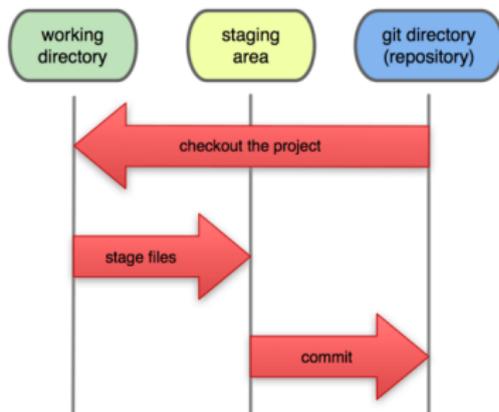

Git

- ▶ Don't confuse Git with GitHub
 - ▶ Git is a version control tool
 - ▶ GitHub provides cloud services using Git (remote repositories, bug tracking, wiki page...)
- ▶ Git is not like Dropbox or Google Drive
 - ▶ True version control, not just file history
 - ▶ Need to resort to console sooner or later
- ▶ Git is not like CVS, Subversion or Perforce
 - ▶ There is no need for a central (such as cloud) repository
 - ▶ You can work offline most of the time
 - ▶ Each local copy contains the full repository's history
- ▶ Devised by Linus, motivated by Linux Kernel development

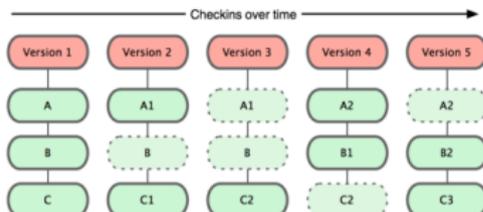

Git: General concepts (I/II)

- ▶ Local operations (staging area == index)

Local Operations

- ▶ Evolution over time

Git: General concepts (II/II)

- ▶ clone: Clone remote repository (and its full history) to your computer
- ▶ stage: Place a file in the staging area
- ▶ commit: Place a file in the git directory (repository)
- ▶ push: Update remote repository using local repository
- ▶ pull: Update local repository using remote repository
- ▶ add: Start tracking a new file, or stage a modified file
- ▶ branch: An end point in the commit tree
- ▶ fork: A copy of another repository for reuse
- ▶ merge: Combine two commits

Private repositories	0	10	20	50	125

Want to run GitHub on your own servers?

With **GitHub Enterprise**, you can build and ship software with your team using all the tools GitHub provides.

Set up Git and GitHub

Go to <http://www.github.com>
and create a user. Choose a nickname you like!

Then go to <http://help.github.com>, look for “Set up Git” and download and install the native app for your platform.

In the process you should also be installing the command-line tools. The apps aren't that good, but keep them just in case.

You should be all set!

Introduction

Basic Git

Branching in Git

GitHub

Hands-on practice

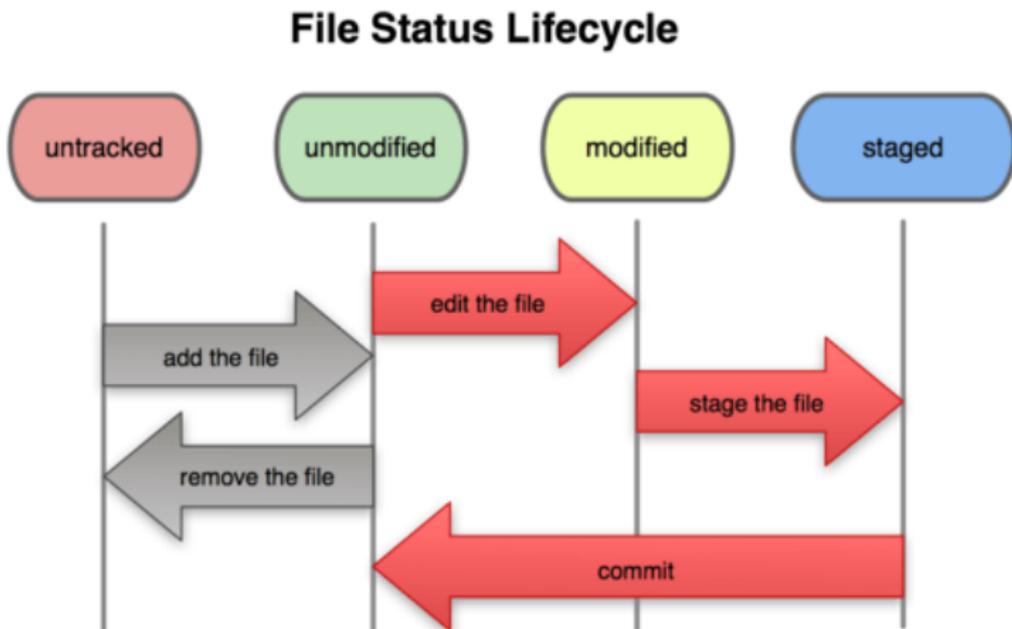

Cloning a repository

This clones a repository (and its full history) to your computer

```
$ git clone https://github.com/lazarox/charla.git
```

- ▶ It creates folder `charla` (your working directory)
- ▶ It creates folder `charla/.git` (the local repository)
- ▶ Might include text files
 - ▶ `charla/.gitignore`
 - ▶ `charla/.gitattributes`
- ▶ Remote server will be referred to as `origin`.

Possible file statuses

Checking the status of things

Tells you about modified files, untracked files, staged files ready for commit, etc. Even provides suggestions about what to do next.

Very useful!

Also informs you about which branch you are at (master)

```
$ cd charla
```

```
$ git status
```

ACTION: Put a file with your name (e.g., miguel.txt) in directory “charla” and then check the status

Start tracking a file

Untracked files in the working directory can't be staged or committed. You can track a file using

```
$ git add miguel.txt
```

Multiple files can be added at a time (don't forget the quotes)

```
$ git add '*.txt'  
$ git add folder
```

ACTION: Track the file you just added and check the status

QUESTION: was the previous diagram accurate?

ACTION: Modify the file that you just added and check the status

QUESTION: What if I commit now? How can we avoid that issue?

Committing changes

Commit *everything* from the staging area to the repository (locally)

```
$ git commit -m 'I improved all files'
```

The message is compulsory! Otherwise, you'd avoid it and soon forget that commit's purpose

Each commit has an identifying SHA-1 hash and comment. You can roll back to past commits.

You can stage everything that is tracked and commit in a single step using

```
$ git commit -a -m 'I improved all files'
```

ACTION: Commit everything.

Removing and moving files

Untrack a file and delete a file, or rename/move a file are modifications

```
$ git rm miguel.txt
```

```
$ git mv miguel.txt newmiguel.txt
```

You will need to commit this changes! As any commit, they can be undone.

If you delete or rename files on your own, Git will notice and you'll still have to stage and commit

ACTION: Delete the file you created, check state, commit

Browsing existing commits

You can see the list of previous commits with

```
$ git log
```

There are many options to filter commits, compare them, see what was added or removed, etc.

```
http://git-scm.com/book/en/  
Git-Basics-Viewing-the-Commit-History
```

ACTION: Browse your current commits

Rolling back a previous commit

You can destructively roll back to a previous commit (as if posterior commits never happened) with

```
git reset --hard <HASH> (to move to that commit)
git reset --hard master^ (to move one step back in master)
```

Or you can move to a previous commit and play around without destroying anything

```
git checkout <HASH> (to move to that commit)
git checkout master^^ (to move two steps back in master)
```

Working with remotes (such as GitHub)

You can download and merge from the remote repository you cloned from

```
$ git pull origin
```

Or upload your local repository to the remote repository you cloned from

```
$ git push origin master
```

This will fail if the repository is ahead of you. Pull, check everything is fine, then push. You can force it with `$ git push --force`, but that destroys the remote! Never do that!

To get info about the remote: `$ git remote show origin`

ACTION: Push your changes. Try an actual merge with collisions!

Browsing current changes

Differences between your working directory and staging area

```
$ git diff
```

Differences between your staging area and your repository

```
$ git diff --staged
```

Contents

Introduction

Basic Git

Branching in Git

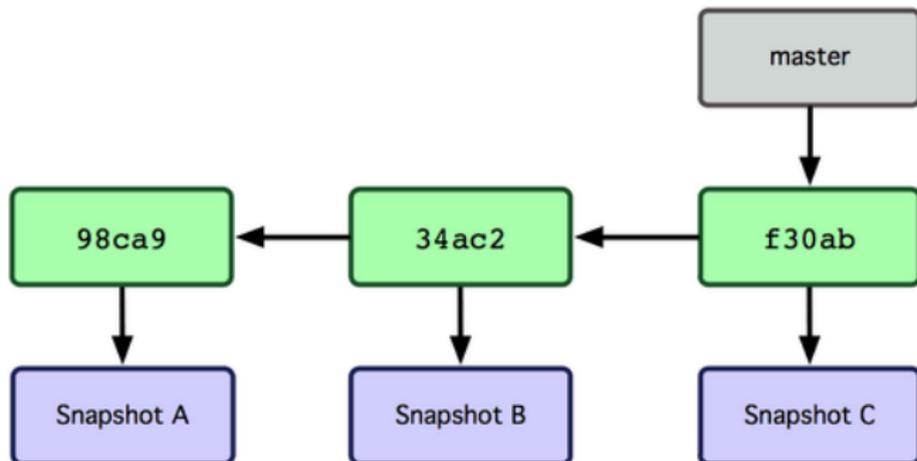

GitHub

Hands-on practice

Branching

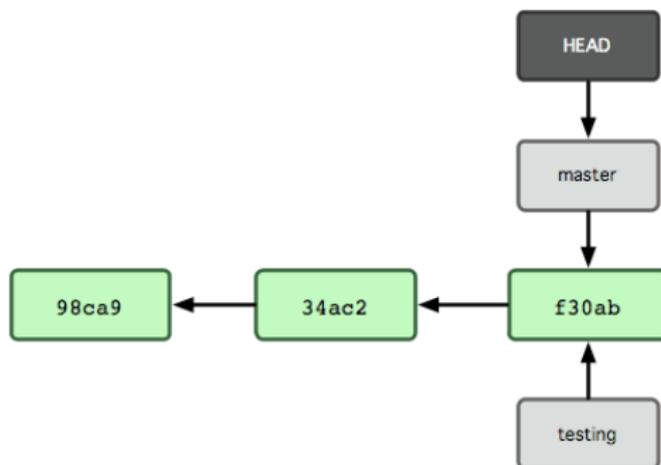

- ▶ Each commit has a pointer to its parent(s) commits.
- ▶ Each branch is a pointer to a concrete commit.
- ▶ The HEAD is a pointer to the current branch.
- ▶ When create a new commit, the current branch moves forward to point to it

Several commits

Creating a new branch

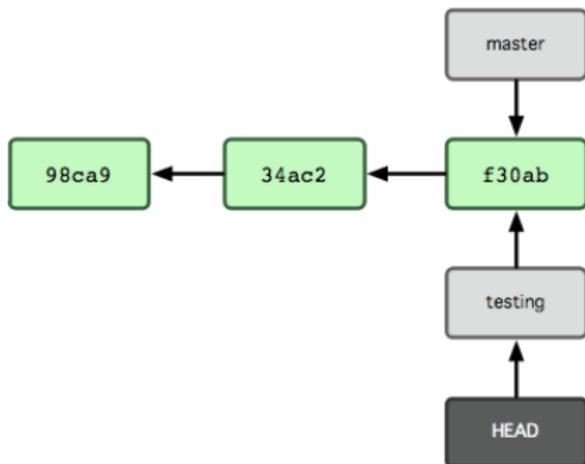

```
$ git branch testing
```

The current branch is still the old one
Use `$ git branch` to list existing branches

Moving to a different branch

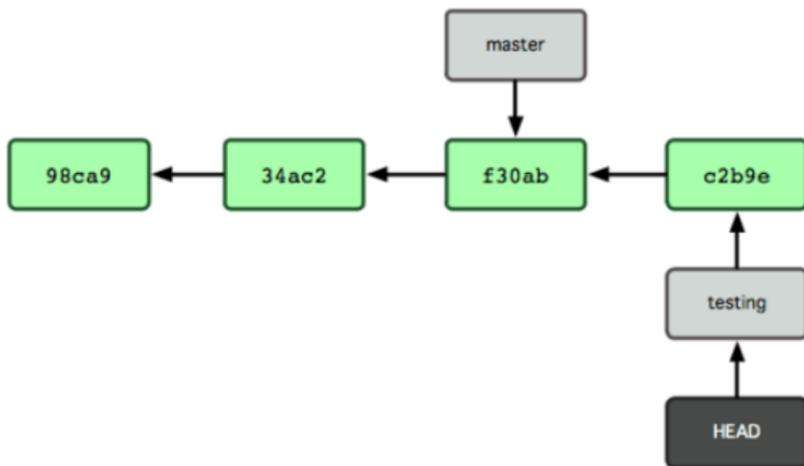

```
$ git checkout testing
```

Short-hand for the previous steps: `$ git checkout -b testing`
You could also checkout commits, and then provide a branch name
Always commit before leaving the current branch!

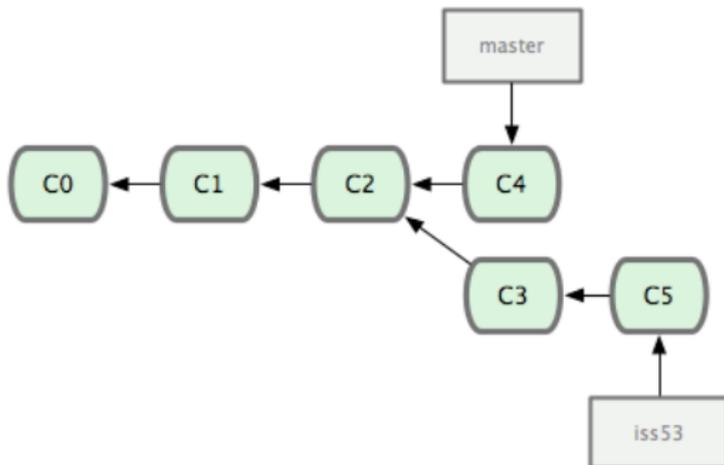

Bifurcations may appear (I/II)

If you now make a new commit while on branch testing...

Basic merge

Given this structure

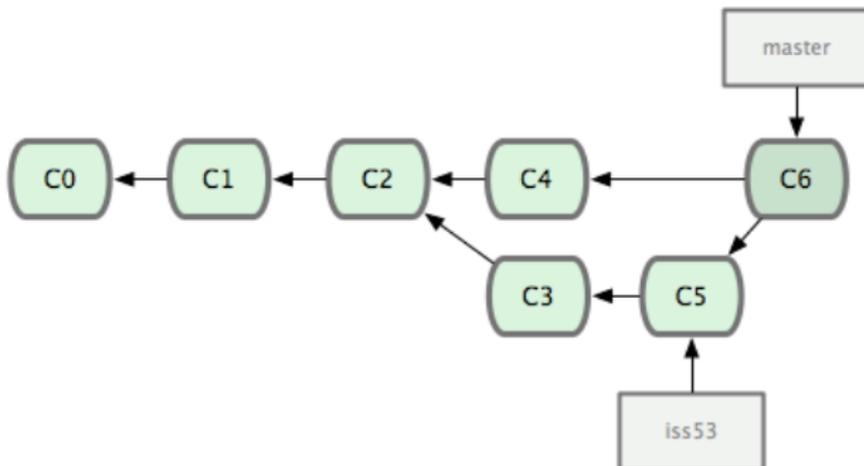

you can merge two commits using

```
$ git checkout master
```

```
$ git merge iss53
```

Deleting branches

After the previous merge, we get

since `iss53` is no longer needed, we can delete it

```
$ git branch -d iss53
```

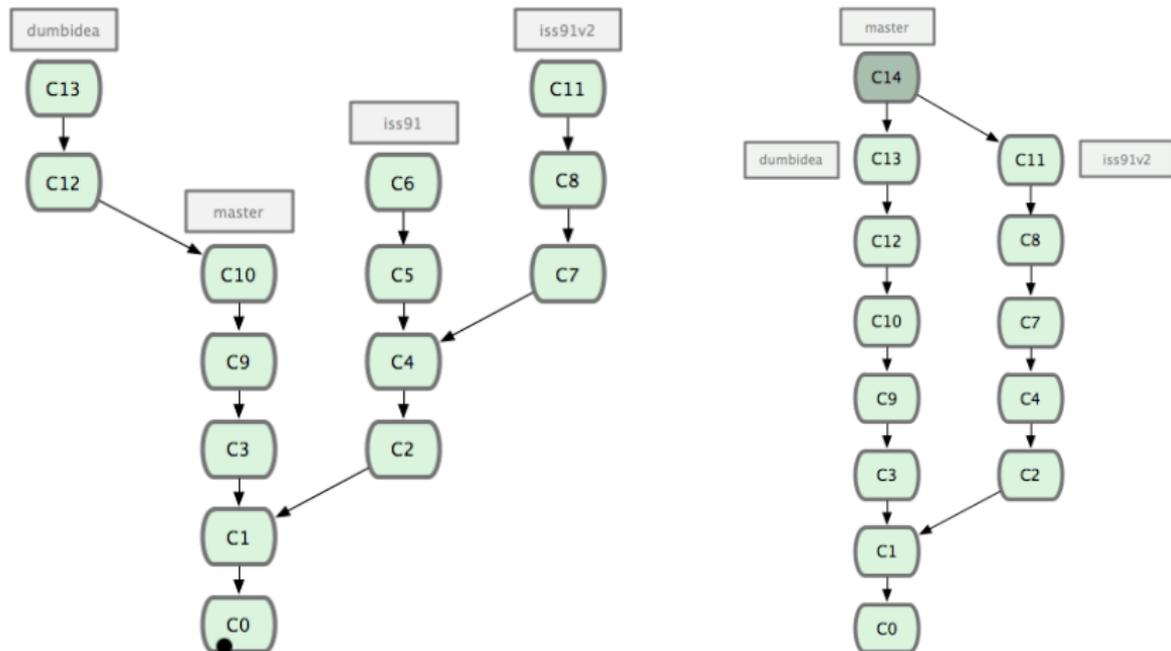

Solving merge conflicts

In case of conflict, no commit occurs. Instead, the working directory has conflicting files like this

```
<<<<<<< HEAD
<div id="footer">contact :
email.support@github.com</div>
=====
<div id="footer">
please contact us at support@github.com
</div>
>>>>>> iss53
```

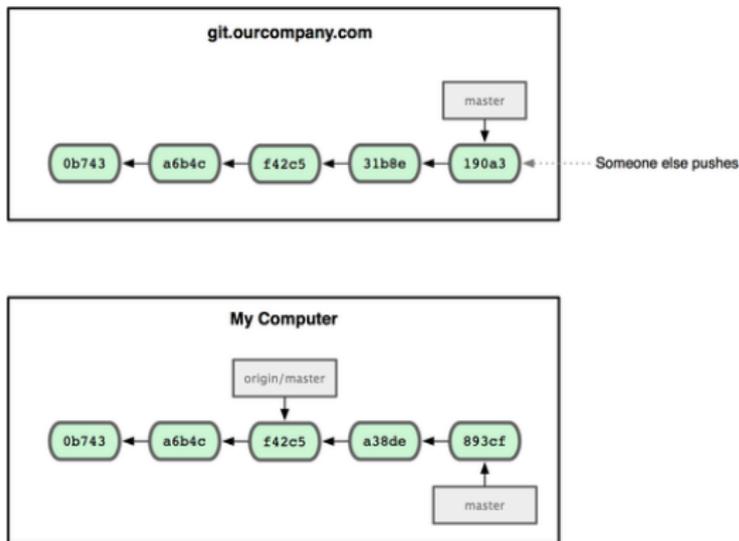

Conflicting files are shown on `$ git status`
To solve conflicts, fix each file and stage it

Sample workflow

Remote repositories

The remote repository and its local snapshot may diverge

Option 1: Pull, solve any conflicts, and then push

Option 2: Use another branch, push it, and issue a pull request

Pull requests

The screenshot shows the GitHub Pull Requests interface. On the left, there is a sidebar with a blue button labeled "All requests" with a count of "1" and a section labeled "Yours" with a count of "1" and a search box "Find a user...". The main area has tabs for "Open" and "Closed", a "Sort: Newest" dropdown, and a green "New pull request" button. A single pull request is displayed, titled "rama2" with the number "#5". The description says "No description available" and it was created "by lazaroX 14 minutes ago" with a "rama2" branch label. On the right, there is a vertical navigation menu with icons for home, search, and pull requests.

Progress tracking towards milestones

The screenshot displays the GitHub Milestones interface. On the left, there are tabs for 'Browse Issues' and 'Milestones', with 'Milestones' selected. Below the tabs, a summary shows 'Open Milestones: 1' and 'Closed Milestones: 0'. A 'Create a new milestone' button is located at the bottom left. The main content area shows a list of milestones. The first milestone is '0.2', which is due by June 11, 2014, and is 50% complete. It has 2 closed and 2 open issues. The progress bar is green and shows 50%. To the right of the milestone, there are links for 'Edit', 'Close', 'Delete', and 'Browse Issues -->'. A comment below the milestone reads 'Tiene que estar todo listo para el miércoles!'. On the far right, there is a vertical sidebar with navigation icons: a double arrow, a magnifying glass, a list icon, a calendar icon, and a person icon.

Other Features: labels, cross-referencing, mark-down, per-line comments in commits, mentions, gists, etc.
